

## SOFTWARE TOOLS SiteAnalysisClient

**Provides data analysis function for data on JTL SiteSuite Server PC.**

- Operates within a Windows environment
- Client application for SiteSuite Server
- Provides access for ongoing system management
- Configurable system performance reporting
- Integrated training module
- Analysis of historic data

### Product Data

#### Product Description

SiteAnalysisClient software is specifically designed to provide site based users with access to the JTL SiteSuite Server data. SiteAnalysisClient enables the user to analyse system operation and event log history.

#### Alarm Management

When an alarm is presented on-site, SiteAnalysisClient provides a range of tools to enable the alarm and data history for the fixture to be investigated.

#### Access Security

Access rights are defined within the network controller licensing policy. This enables only those users with the appropriate rights to view and analyse the data.

#### Data Archiving

Event and log records stored on the hard drive of the site PC can be backed up. Where the PC is connected to the customers IT network, the network administrator can configure an automatic data backup

#### System Performance Reporting

User definable reports can be generated from event logs held within the datalogging PC. This enables users to identify high alarm levels by fixture, type or product category, thereby targeting pro-active system management. SiteViewClient also provides access to archived data logs which can be displayed, saved, printed or exported using standard wizard assistance.

## Minimum Hardware Requirements

Operating system*	Windows 95, 98, ME, NT, XP, 2000
Processor	Pentium or equivalent
Peripheral	CDRom drive
